

what is snowflake:-

snowflake is a cloud based data platform that functions as a data warehouse and analytics service.

It separates storage and compute resources, allowing for independent scaling and cost optimization.

why companies are using snowflake:-

companies use snowflake because it's a unique cloud-native architecture provides high performance, near-unlimited and independent scalability of storage and compute, ease of use with minimal management overhead, and robust data sharing capabilities.

what is computing and storage:-

computing is the processing of data and running applications, while storage is the technology used to save and retain that data.

what is data type:-

data type defines the type of value a field can store such as number, text, date, or boolean.

what is structured data:-

data that is organized in rows and columns and easy for machines to read.

→ Has a fixed format
can be stored in relational databases

eg:- excel sheet

what is semi-structured data

data that has some structure, but not stored in tables

→ Has tag or key

→ not fully organized like a database

→ stored in flexible formats

eg:- XML

unstructured data:-

data that does not have a fixed format or structure

→ cannot be stored in tables

eg:- images, videos
