

Snowflake

In today's class, I created a snowflake account. Then, I explored some features of the snowflake.

Worksheet:

We can use this platform, we have different kind of worksheet, SQL worksheet, Python worksheet and Notebook etc.,

We can also rename the worksheet.

In Search, we can able to search the files.

Project:

In project things, it has all the worksheets, notebooks, streamlet, it can all the things.

Ingestion:

1) load data into a table $\Rightarrow$ upload file, insert table.

2) load file into a Stage $\Rightarrow$ upload files to - snowflake storage.

3) Snowflake Stage $\Rightarrow$ Internal storage area to store files loading them into tables.

4) AWS S3 $\Rightarrow$ Amazon S3, bucket to Salesforce.

User and Roles:

User is nothing but going to interact with the ~~human~~ Snowflake.

Roles:

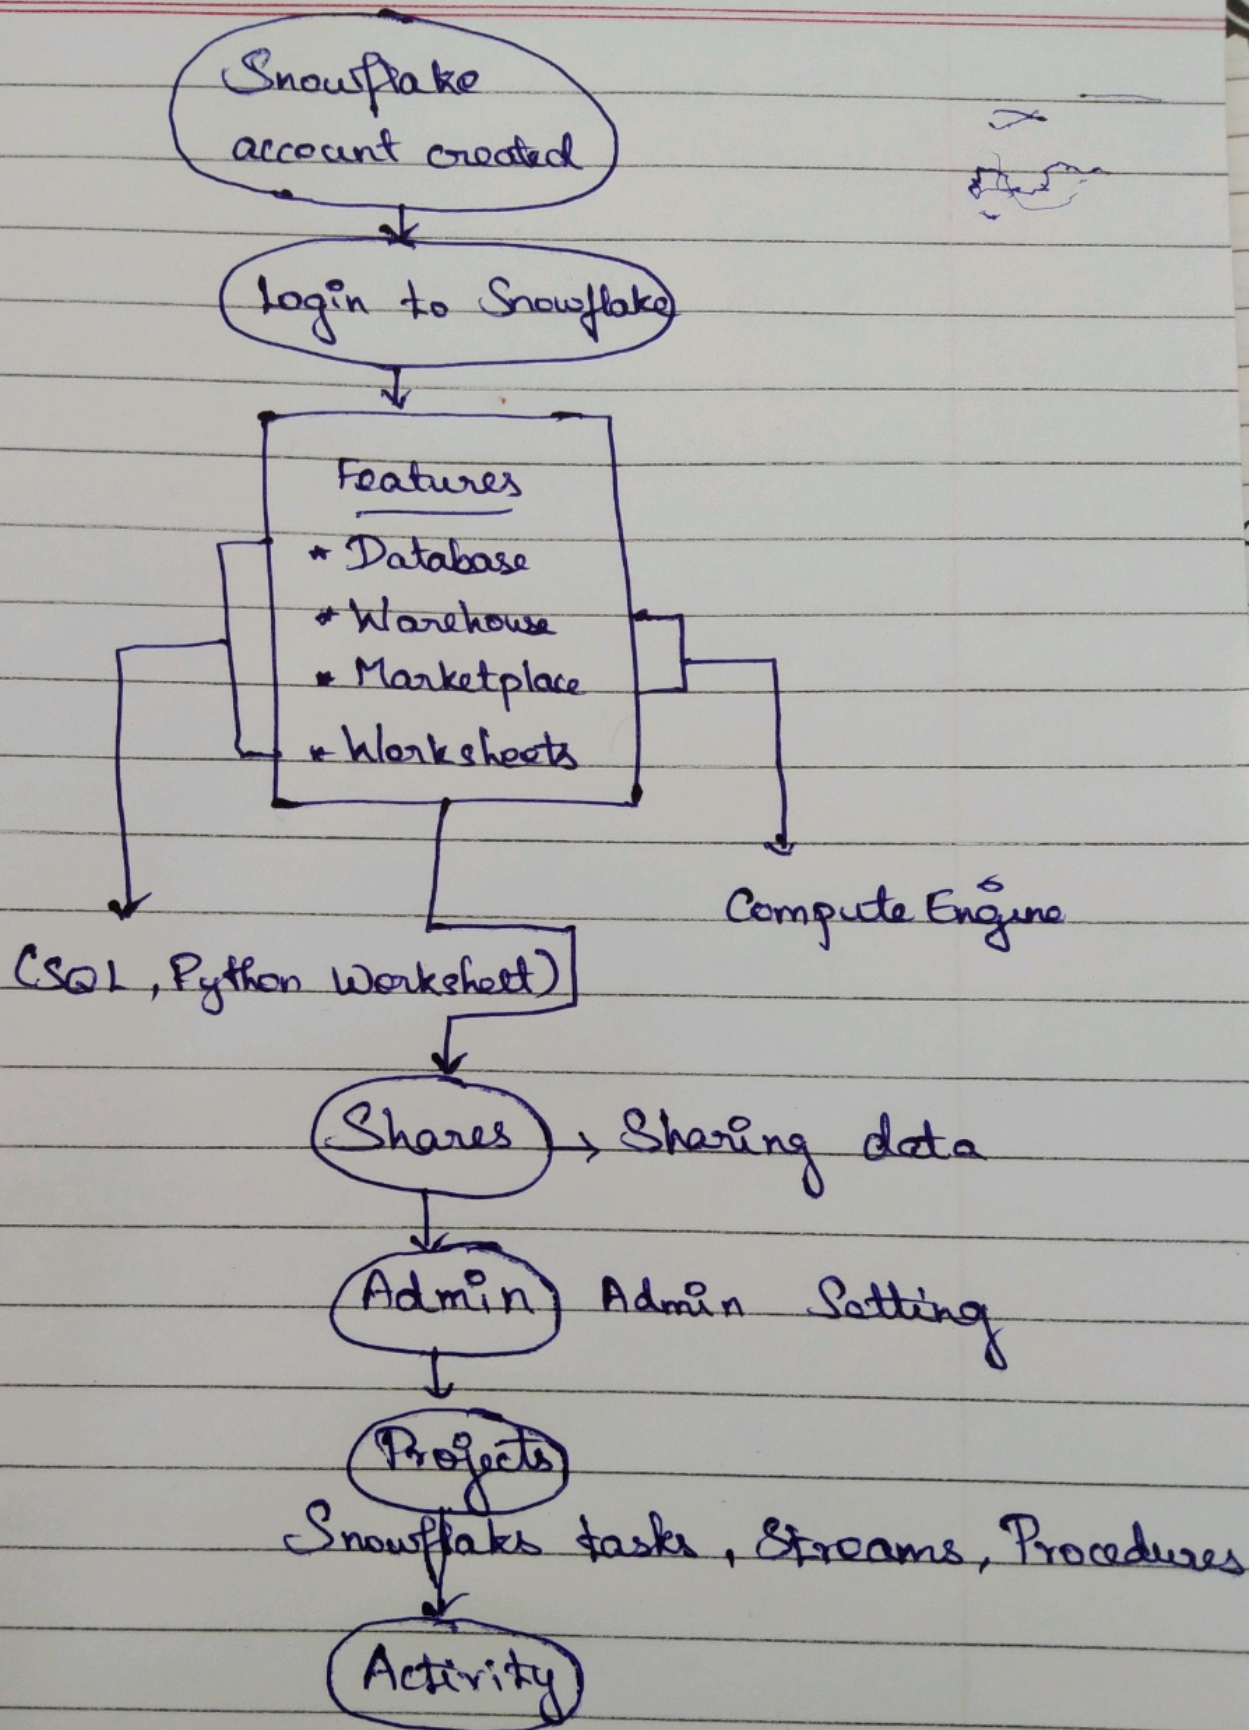

Roles is nothing but, I wanted to communicate between the two system.

Storage:

In this, it has size of the file (ex: small).

In suspend, we need to give suspend after finishing, otherwise it gets charged.

And it starts resume if any query (or) things happen.

It shows Query history and warehouse - usage.
